WE UNDER STAND

The Gravity of the Situation

MIETHKE

TOGETHER FOR A BETTER LIFE **WITH HYDROCEPHALUS**

We have a long and intensive partnership with B. Braun in the field of neurosurgery. We are driven by a common vision: to improve the lives of hydrocephalus patients around the world with innovative solutions.

Our Strong Partner in Neurosurgery:

B BRAUN

B BRAUN
SHARING EXPERTISE

"Our partnership with B. Braun has always been based on trust, expertise and mutual respect on an equal footing. This was already the case in 1999, when we began our joint journey with B. Braun as an innovative start-up. Today, this partnership also means friendship for us with so many long-standing companions worldwide."

Christoph Miethke, CEO and founder of Christoph Miethke GmbH & Co. KG.

MIETHKE

OUR PARTNERSHIP **WITH B. BRAUN**

What connects us is an intensive and simultaneously a very special partnership with B. Braun.

Together we have been successfully selling MIETHKE products in more than 60 countries worldwide for many years.

Our cooperation is an exciting combination of B. Braun's almost 185 years of expertise as one of the world's leading medical technology companies and our agility as an innovative company and technology leader for gravity-based shunt technology. Above all, however, it is supported by a large number of colleagues, product experts and international contacts with a shared understanding of values.

We listen carefully to the voices of patients and neurosurgeons around the world and constantly question our own status quo. We passionately research, learn, develop and share our knowledge.

TOGETHER FOR A BETTER LIFE **WITH HYDROCEPHALUS**

We share a common vision: to improve the lives of hydrocephalus patients around the world with innovative solutions. What drives us every day is our responsibility for people. With quality, responsibility, scientific and meticulous work, proximity, diversity and mutual respect, we want to meet this responsibility together and worldwide every day.

This is not just a promise but a self-conception of who we are.

TREATMENT OF HYDROCEPHALUS
NEED FOR IMPROVEMENT

TREATMENT OF HYDROCEPHALUS

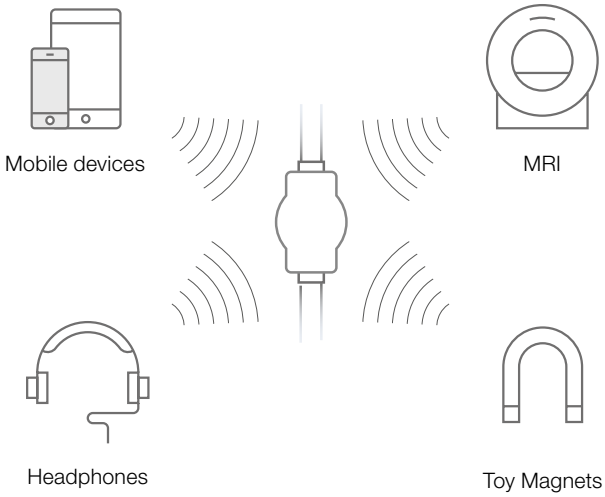
Since the 1960s, the main surgical strategy in managing hydrocephalus is the placement of shunts. Ventriculoperitoneal (VP) shunts are still the surgical standard, but lumboperitoneal (LP) shunts are an increasingly important alternative. However, these conventional shunt types have specific high failure rates, each with its own typical causes. Almost every fourth patient is affected by complications (1, 2) with no difference between conventional and programmable valves (3, 4).

Mechanical failure, such as obstruction and valve malfunction, followed immediately by overdrainage, remain the most common causes of multiple shunt revisions (5). Revisions are burdensome for patients and are accompanied by unavoidable perioperative risks.

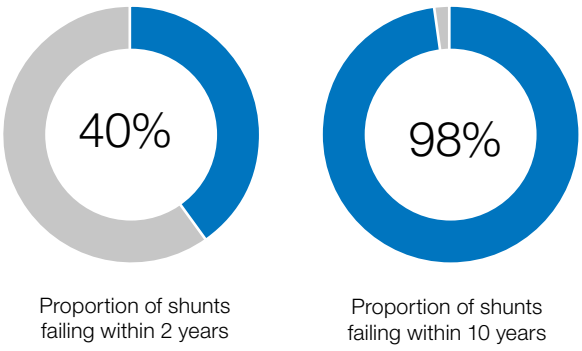
We believe that the current treatment options for hydrocephalus are not definitive and improvement is required.

ACCIDENTAL REPROGRAMMING

As the optimal pressure setting of adjustable valves is of great importance for the patient, the accidental reprogramming of adjustable valves by external magnetic fields, e.g., from smartphones, is a cause of concern and leads to great uncertainty among patients and doctors (6-10).



HIGH FAILURE RATES

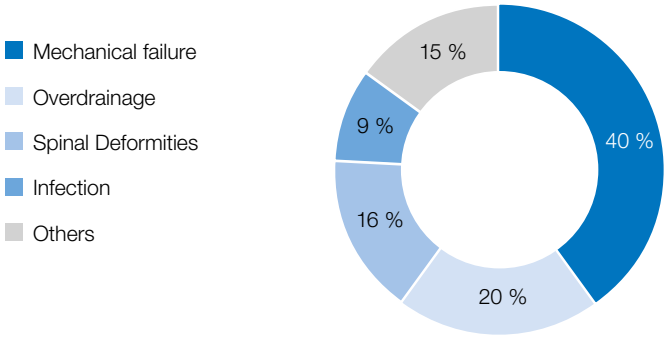


Proportion of shunts failing within 2 years

Proportion of shunts failing within 10 years

» *High failure rates overshadow the effectiveness of shunts (1).* «

COMPLICATIONS LP-SHUNTING (5)



» *About one in four patients experiences at least one complication (2).* «

GRAVITATIONAL VALVES BY MIETHKE
DEVELOPED TO ENSURE SAFETY

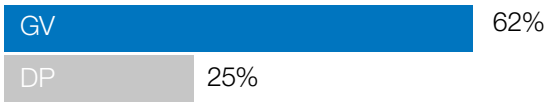
BE CONFIDENT!

Gravitational shunts provide neurosurgeons with a possibility to address the posture-dependent effects of gravity, with positive clinical outcomes for the patient and a significant reduction of overdrainage events (11-13).

GRAVITATIONAL VALVES (GV) IMPROVE PATIENT OUTCOMES COMPARED TO DIFFERENTIAL PRESSURE VALVES (DP) (14).

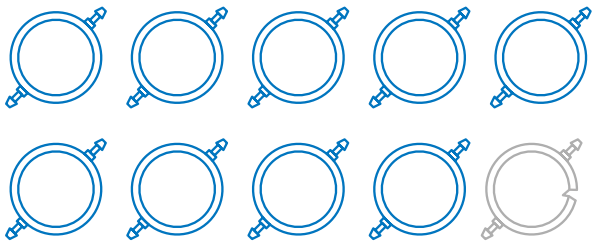
Symptom improvement >2 points on Kiefer-Scale

Daily improvement rated good / very good on Black-Scale

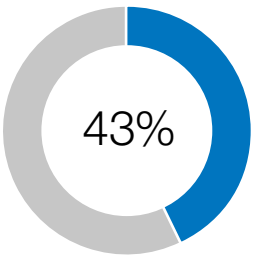


REDUCE COMPLICATIONS!
REDUCE REVISIONS!

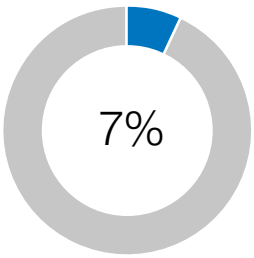
Clinical studies have shown that MIETHKE gravitational devices reduce the risk of revisions (15-19) and overdrainage complications (8, 13).



» *Valve survival rates up to 90% at 12 months (17).* «



Overdrainage rate with **differential pressure valves** (16)



Overdrainage rate with **gravitational valves** (16)

» *Implanting a gravitational valve avoids one additional overdrainage complication in about every third patient (16).* «

GRAVITATIONAL VALVES BY MIETHKE
DEVELOPED TO ENSURE SAFETY

AVOID MECHANICAL FAILURE!

All MIETHKE valves are manufactured with high precision from titanium. The small valves have aligned flow paths, rigid housing unsusceptible to subcutaneous pressure and high MRI- and biocompatibility.

DON'T LET MAGNETIC FIELDS BOTHER YOU!

The "Active-Lock mechanism" protects programmable MIETHKE valves against reprogramming by magnetic fields of up to 3 Tesla (20).

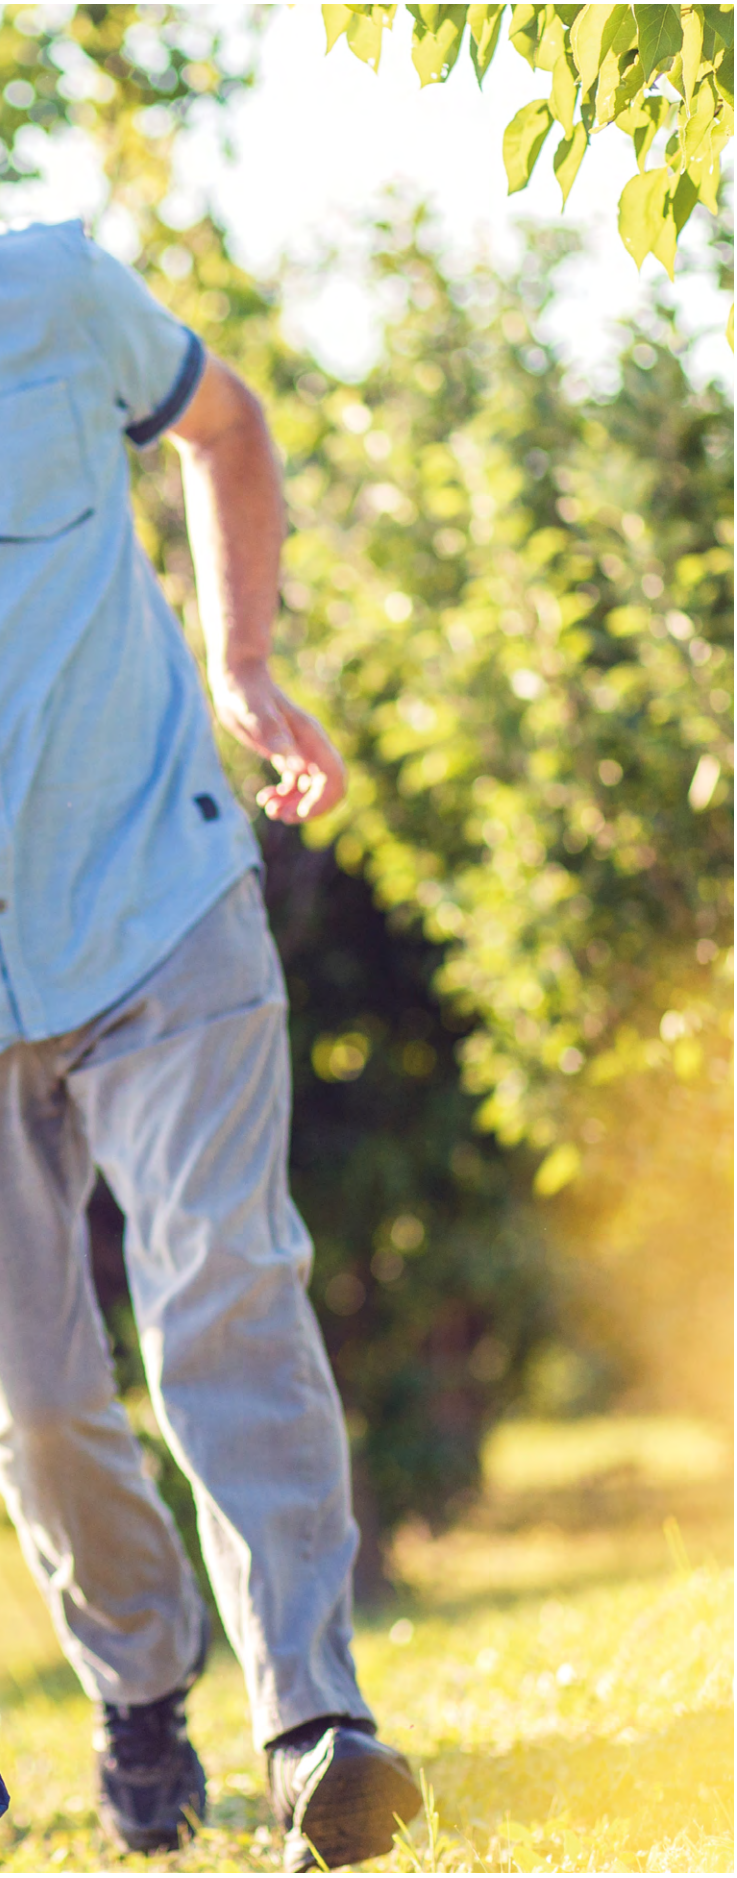
MIETHKE GRAVITATIONAL VALVES

Made from Titanium for high MRI- and biocompatibility

Protected against reprogramming up to 3 Tesla

Small valve

Rigid housing unsusceptible to subcutaneous pressure



BENEFIT FROM PRIMARY IMPLANTATION (21)!

22%

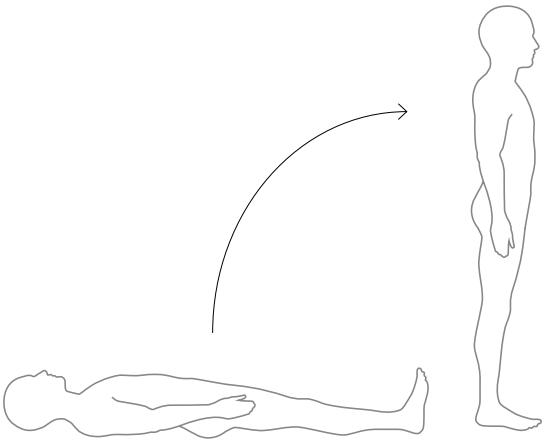
» *higher survival of gravitational valves after primary vs. secondary implantation.* «

GET IT RIGHT THE FIRST TIME!

Early treatment with the optimal therapy is important for patients with hydrocephalus (21, 22) and can also help to avoid shunt replacements and associated perioperative risks.

OPTIMIZE – DON'T COMPROMISE!

Gravitational shunts allow for the prevention of overdrainage in the standing position without compromising the pressure setting for the supine position. The optimal opening pressure for each patient can be set both for the upright and the supine position – without needing to compromise.



» *With gravitational valves the optimal pressure for both supine and upright position can be set.* «

HYDROCEPHALUS THERAPY
LUMBOPERITONEAL SHUNT AS AN ALTERNATIVE

MIETHKE develops innovative gravitational valves with low opening pressures in supine position and simultaneous high overdrainage protection in upright position, that improve patient outcome compared to conventional differential pressure valves (14, 16). This reflects our philosophy to provide the best possible treatment of hydrocephalus.

VP-shunt placement is the most common treatment, whereas LP shunts are less commonly used due to initial reports of high rates of complications (23).

Recent international studies provide evidence that LP-shunting is equally as effective as VP-shunting for normal pressure hydrocephalus (NPH) and is associated with comparable complication rates (24-27); without statistically significant difference between the two groups (25, 26, 28). As a matter of fact LP-shunting has become an increasingly popular treatment option (24, 26-31).

Early treatment with the optimal therapy is essential (32). Hydrostatic pressure is created in every patient in an upright position driven by gravity. VP- and LP shunts are in principle equally at risk of overdrainage in standing position, if no resistance compensation is considered, such as gravitational valves. Thus, avoiding overdrainage is just as important for LP- as it is for VP shunts (27).

Modern gravitational valve technology from MIETHKE, which has proven its superiority in overdrainage prevention for VP shunts, can now also be used for LP shunts using the MIETHKE *Valve Board* (15, 20).

ADJUSTABLE GRAVITATIONAL VALVES AND ACCESSORIES

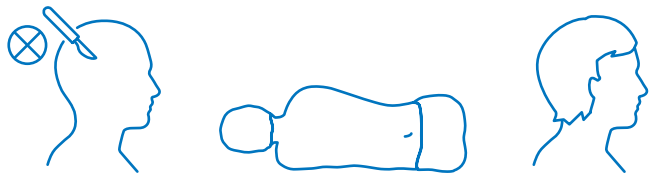
Meeting important requirements of neurosurgeons and patients

- Valve technology for the special requirements of a life with hydrocephalus: mobility, growth, changes in the course of disease
- Superior clinical outcome of gravitational valves: survival rates, improvement in patient symptoms
- Reliable overdrainage protection
- MRI conditional up to 3 Tesla
- Safe from unintentional adjustment by everyday magnets such as smartphones, toys, induction cookers and safety barriers at the airports

MIETHKE *Valve Board*: FLEXIBILITY AND SAFETY IN APPLICATION

- Various treatment options: *M.blue, proGAV 2.0, GAV 2.0* and *SHUNTASSISTANT 2.0*
- Different configurations available: with and without *CONTROL RESERVOIR*
- Various placement options: e.g. dorsal, paramedian; ventral, anterolateral; thoracic
- Firm and reliable fixation for axial alignment of gravitational valves
- Integrated kinking protection of catheters
- Intuitive, secure and comfortable instruments

POTENTIAL BENEFITS FROM LP SHUNTS (29, 33)



No cranial surgery, minimally invasive

Small postoperative scars

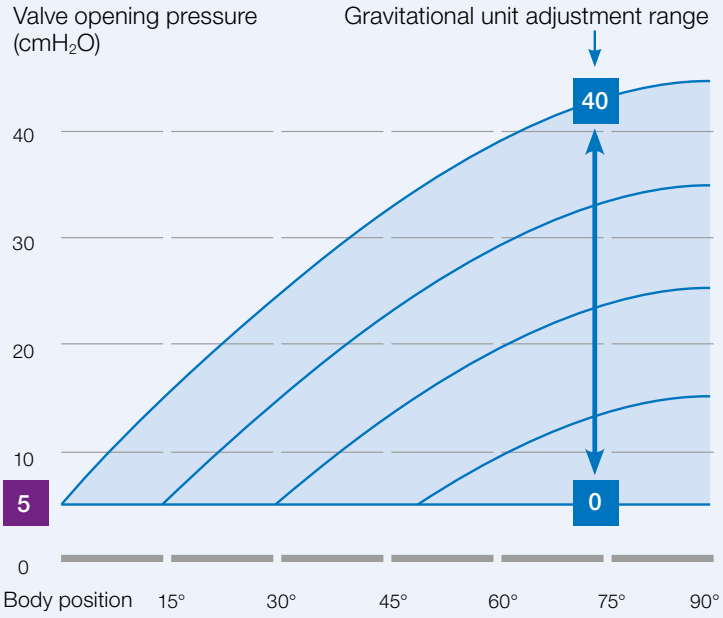
No head shaving

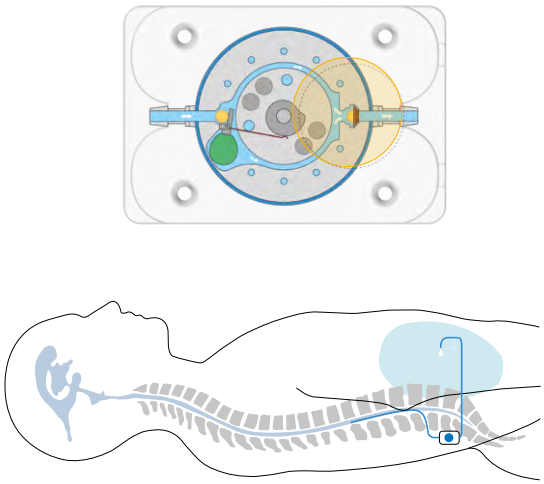
HYDROCEPHALUS THERAPY

FUNCTIONALITY OF GRAVITATIONAL VALVES AND PRESSURE LEVEL RECOMMENDATION

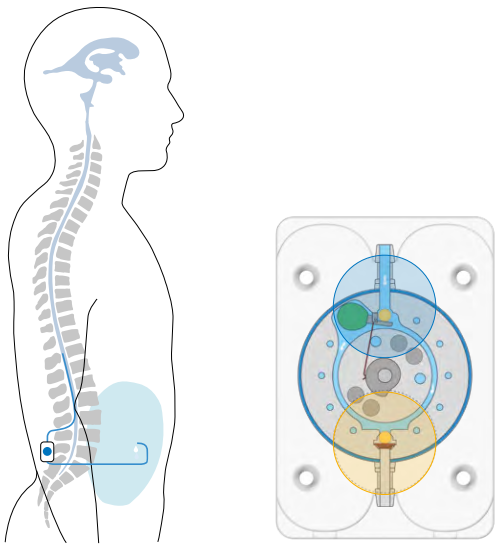
Example of the adjustable gravitational pressure range of an *M.blue LP* with a differential pressure unit of 5 cmH_2O

MIETHKE GVs are hydrocephalus valves operating in a position-dependent manner. GVs consist of a gravitational unit and a differential pressure unit. The combination of these two units adjusts the opening pressure automatically depending on what position the patient is in, thus countering the risk of possible overdrainage complications, particularly when the patient is in an upright and active position.





Only the differential pressure unit is active when the patient is supine.



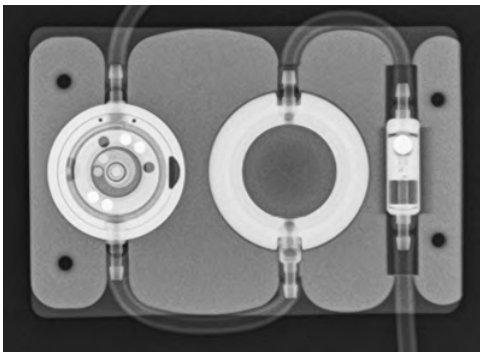
Gravitational unit and differential pressure unit work together when the patient is standing.

STANDARD PRESSURE LEVELS*

The choice of the appropriate pressure level depends on several factors, including age, degree of activity, size and stature of the patient.

Patient	Selection of pressure levels		Opening pressure in total	
	differential pressure unit	gravitational unit	horizontal position	upright position
Adults	5	25	5	30
Adults < 1.60 m	5	20	5	25
Adults > 1.80 m	5	30	5	35
Adults from 65 years	5	20	5	25
Adults from 65 years < 1.60 m	5	15	5	20
Adults from 65 years > 1.80 m	5	25	5	30

All indicated pressure levels are in cmH_2O.
* This is a non-binding recommendation for the attending physician. According to his diagnosis, the physician decides each case independently, without instructions and individually. The stated values consider the current scientific knowledge up to 02/2021



X-ray image of *Valve Board* with *proGAV 2.0 LP right* with *CONTROL RESERVOIR*, (pressure level of *proGAV 2.0* - 20 cmH_2O, pressure level of *SHUNTASSISTANT 2.0* - 20 cmH_2O)

X-ray recognition and product information can be found in the free MIETHKE App.

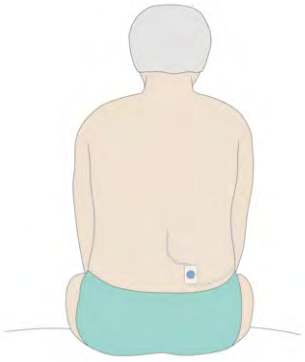
HYDROCEPHALUS THERAPY
VALVE ADJUSTMENT IN LUMBOPERITONEAL SHUNTS

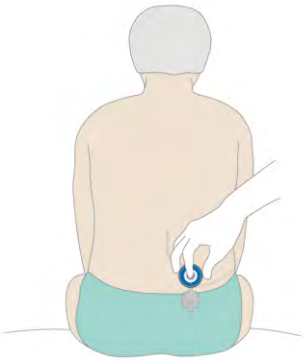
SOFT TOUCH INSTRUMENT FUNCTIONALITY
USER-FRIENDLY ADJUSTMENT AND VERIFICATION

Innovative *M.blue plus Instruments* allow users to measure, verify and adjust the pressure level on *M.blue*'s adjustable gravitational unit (0-40 cmH_2O) as well as the pressure level on the adjustable differential pressure unit *proGAV 2.0.* The instruments offer simple steps for the physician and make the adjustment process comfortable for patients.



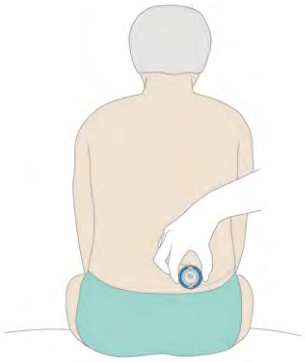
ADJUSTMENT OF MIETHKE LP SHUNTS

Patient after LP-shunting in a sitting and slightly bent downward position for shunt valve adjustment.



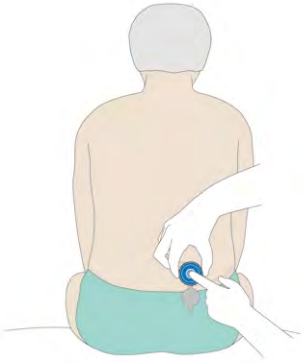
LOCATE

Locate valve by palpating the area with your finger through the open *M.blue plus Compass*.



CHECK

Close *M.blue plus Compass* and use the floater to lock location and read current valve opening pressure settings.



ADJUST

With the help of the inserted *M.blue plus Adjustment Ring* the valve opening pressure can easily be set to the desired level. After setting the valve opening pressure, it is advisable to double-check the pressure level settings.
